1 Introduction

The TFP3 (The Flash Programmer 3) is a multipurpose device from Maxim Integrated used to perform flash program and erase operations on Maxim energy metering SoCs. The available versions of the TFP3 are listed in *Table 1*.

Table 1: TFP3 Versions

ID	Function	Ordering Part Number
TFP3-8051	Flash Programmer for 8051-based Metering Devices. With Security ⁽¹⁾	80515-FPBM-TFP3
TFP3L-MAXQ30	Flash Programmer for ZON™ Family Metering Devices (MAXQ®-based). No Security	MAXQ30-FPBM-TFP3L#
TFP3Q-MAXQ30	Flash Programmer for ZON™ Family Metering Devices (MAXQ-based). With Security ⁽¹⁾	MAXQ30-FPBM-TFP3Q#

(1) With the security feature, the programming content is stored, programmed, and verified using AES 128-bit security.

2 TFP3 Kit Contents

- TFP3 Device
- FC-10 cable for CC51 or JTAG connection, 20-25cm in length
- USB A-to-B cable used to connect the TFP3 to the host (PC) or to a USB 5V DC adapter (not provided with the kit)
- CD-ROM containing:
 - TFP3 Windows installation executable (TFP3 XX-YY.exe) with Microsoft .NET 4.0 packaged for TFP3 GUI and CLI application software
 - o TFP3 Host USB CDC driver
 - o TFP3 User's Guide
 - TFP3 Quick Start Guide

MAXQ is a registered trademark and ZON is a trademark of Maxim Integrated Products, Inc.

3 Setup and Operations

Figure 1 shows the basic connection diagrams for the TFP3 for programming ZON (MAXQ30-based) and 71M65xx (8051-based) parts. It is possible to operate the TFP3 in both stand-alone (only target and TFP3) and PC-connected configurations. For stand-alone configurations, the TFP3 must be powered through the USB adaptor.

The ZON SOC or 71M65xx SOC is referred to as the target or DUT (device under test). The TFP3 contains the target image, i.e. the operational code for the flash memory of the target, in encrypted form (TFP3Q-MAXQ30 and TFP3-8051) or unencrypted form (TFP3L-MAXQ30).

Figure 1: TFP3 Typical Connection Diagram

3.1 TFP3 Connection to the Host

Connect the USB A-B cable to the TFP3 (Host/Power Port) as shown in *Figure 2*. Plug the other end of the USB cable into an available USB port of a PC.

Figure 2: TFP3 Connection to Host

When the notification window with the text, "Installing device driver software," appears on the PC screen, go to <u>Start</u> > <u>Control Panel</u> > <u>Device Manager</u> > <u>Other Devices</u>. Right-click on "MAXQ CDC-ACM Demo," and then update the driver software by pointing to the "OEM54.INF" file on the CD-ROM supplied with the TFP3 Programmer's Kit.

Figure 3: Device Manager

When the TFP3 Host driver software installation is successful, the TFP3 device is enumerated as a COM port, as shown in *Figure 4*.

Figure 4: COM Port Enumeration

3.2 TFP3 Software GUI Installation

Insert the CD-ROM supplied with the TFP3 Kit into your PC and browse to the TFP3 Host software directory. Double-click the file named "**TFP3 - XX.YY.exe**" to start the installation process ("XX" and "YY" are major and minor versions, respectively). Follow the on-screen instructions carefully to successfully complete the TFP3 host software installation.

3.3 TFP3 Connection to Target

The 2x5 connector labeled "ICE" is intended for the target cable. *Table 2* shows the signal assignment on this connector. Pin 1 is in the top right position when looking at the connector from the outside, and pin 2 is on the bottom-right.

3.3.1 TFP3 Connected to ZON Device (TFP3Q-MAXQ30 and TFP3L-MAXQ30)

Plug the gray flat-ribbon cable into the 2x5 connector labeled "ICE". Plug the other end of the cable into the JTAG programming connector on the target device. Pin 1 is marked with a triangle on the black connector body. An adapter should be used if the signal assignment on the target device is not per *Table 3* or if a different connector type is used on the target device.

Pin Number	Signal	Function
1	ICE_E	Enables the programming interface when high
2	GND	Ground, return
3	E_RST	Emulator reset
4	VCC	Supply power (+3.3VDC at 300mA, max)
5	E_TCLK	Emulator clock
6	TMUX	Optional signal. Not required for programming
7	N/C	Not connected
8	N/C	Not connected. (+5VDC for TFP3L-MAXQ30)
9	E_RXTX	Emulator data (RX and TX), bidirectional
10	GND	Ground, return

Table 2: ICE Connector to JTAG Cable (2x5)

Note: If pin 4 in *Table 2* is used to power the target, then a 1000μ F/10V capacitor should be placed in between VCC and GND of the target board in order to prevent the TFP3 device from resetting due to the inrush current.

To ZON Device

3.3.2 TFP3 Connected to 71M65xx Device (TFP3-8051)

Plug the multi-colored flat-ribbon cable into the 2x5 connector labeled "ICE". Plug the other end of the cable (7x1 connector) into the programming connector on the target device. Pin 1 is marked with a triangle on the black connector body. An adapter should be used if the signal assignment on the target device is not per *Table 3* or if a different connector type is used on the target device.

Pin Number	Signal	Function
1	TMUX	Optional signal
2	ICE_E	Enables the programming interface when high
3	GND – RETURN	Ground, return
4	E_RST	Emulator reset
5	E_TCLK	Emulator clock
6	E_RXTX	Emulator data (RX and TX), bidirectional
7	VCC	Supply power (+3.3VDC)

Note: Even though the TFP3 can supply power to the target, many target boards (e.g. 71M653x, 71M652x) assign V3P3D to the pin corresponding to pin 7 in *Table 3*. This means that the target boards still need to be powered with a separate DC supply. If pin 7 is used to power the target, then a 1000μ F/10V capacitor should be placed in between VCC and GND of the target board in order to prevent the TFP3 device from resetting due to the inrush current.

To 8051 Device

3.4 Device Operation (TFP3Q-MAXQ30, TFP3-8051)

3.4.1 TFP3 Device Initialization

This section covers the initialization of the TFP3-8051 and TFP3Q-MAXQ30. The settings of the TFP3 are automatically stored, so no further operation is necessary after initialization.

The following steps are necessary to initialize and load the target code onto the TFP3.

- Open the TFP3 GUI on the PC by clicking on <u>Start</u> > <u>All Programs</u> > <u>Maxim Integrated</u> > <u>TFP3</u>
 > <u>TFP3GUI.exe</u>.
- 2. Select the Model type and DUT (target) flash size from the drop-down menus.

Figure 5: Selecting the TFP3 Model and Target Flash Size

- **3.** Normally, the TFP3 GUI auto-detects and connects to the TFP3 device. To manually connect to the TFP3, it is necessary to perform the following steps:
 - a. On the **Options** menu, select **Configure Serial Port**.
 - **b.** On the **Device** menu, select **Connect To TFP3 Device**.

3.4.2 Encryption and Package File Generation (TFP3Q-MAXQ30, TFP3-8051)

The encryption of the program/target file ensures that its content is secured and not accessible to anyone without the key. AES encryption is used with a key size of 128 bits. Since AES implements a symmetrical encryption method, the same key is used for both encryption and decryption.

Note that the content encryption is only needed for the TFP3Q-MAXQ30 and TFP3-8051, which feature the security function. Once a programming package is loaded on the TFP3, the content is locked. A new programming package file can be uploaded only if it contains an AES key matching the one previously loaded or if the TFP3 has been initialized by a factory reset.

3.4.2.1 AES Key Generation

The AES key generation is needed in case the previous AES key is not trusted.

Once the TFP3 is successfully connected to the Loader, select File > TFP3 Configuration Commands > Generate TFP3 AES Keys.

(🎲 TFP	3Q – MA	XQ30 - Use

L		TFP3 Up	grade Con	nmands	•		Modify TFP3 AES Keys	
		Exit Ctrl-Q			Reset TFP3 Diagnosis Info			

Figure 11: Generate TFP3 AES Keys

Specify the name of the new AES key file.

3.4.2.2 AES Key Modification

This step is needed to allow the newly generated programming package to be loaded in aTFP3 device. In order to do so, the AES key used in the previously loaded programming package (the "old" key) must be entered. The steps necessary to do this are indicated below. Alternatively, a new programming package (with a new AES key), can be loaded after performing a factory reset on the TFP3.

On the File menu, select TFP3 Configuration Commands > Modify TFP3 AES Keys.

🚯 TFP3Q – MAXQ30 - User Mode (128 k	(B)

TFP3 Programming Commands	•	Generate TFP3 AES Keys	
TFP3 Upgrade Commands	•	Modify TFP3 AES Keys	
Exit Ctrl-0	2	Reset TFP3 Diagnosis Info	

Figure 12: Modify TFP3 AES Key

Note: Follow the instructions on GUI console for completion of the command.

The old AES key file would contain the key used for the package file already loaded in the TFP3. This will allow performing operations on a previously loaded TFP3 device.

A default key is available with the GUI installation package: AES_Keys_old.pas

3.4.2.3 Create Package File

The package file is a text file containing the encrypted target image. Create the package file by selecting File > TFP3 Programming commands > Generate TFP3 Package file.

[6) TF	P3Q – M/	AXQ30 - Use	er Mode (12	28 KB)

Figure 15 summarizes the encryption process.

Figure 15: Encryption Process

3.5 Device Operation (TFP3L-MAXQ30)

The following steps are necessary to initialize and load DUT code into the TFP3L device. The settings of the TFP3 programmers are automatically stored, so no further operation is necessary.

- Open "TFP3GUI.exe" in your PC from Start > All Programs > Maxim Integrated > TFP3 > TFP3GUI.exe.
- 2. Select TFP3 Model and DUT Flash Size
 - **a.** Select Model type and DUT flash size from the drop-down menus.

3.6 Target Programming

The target device can be programmed and verified by one of the following methods:

- **Stand-alone mode:** No PC is connected to the TFP3. The programming operation is started by pressing the red pushbutton.
- **Host mode:** The TFP3 is connected to both the target and to the PC. The programming operation is started using the GUI.

3.6.1 Stand-Alone/Pushbutton Mode

Connect the target DUT to the TFP3 device using the target cable. Connect the TFP3 to a 5V USB adaptor. Wait until the TFP3 status LED turns green. Then press the red pushbutton on the TFP3 device for at least 0.3 seconds, and then release it. This will initiate the program and verify operation.

Figure 22: Stand-Alone/Push Button Mode

Note: In order for the TFP3 to operate properly in Stand-Alone mode, the USB cable should be disconnected from the Host PC GUI.

3.6.2 Host Mode

Connect the target DUT to the TFP3 device using the target cable. Connect the TFP3 device to the PC with the USB cable. Wait until the TFP3 status LED turns green, and then open the TFP3 GUI. Send the program and verify DUT command by selecting **File > TFP3 Programming Commands > Perform DUT Program And Verify**.

REVISION HISTORY

Revision, Date	Change	Page(s)
2.3, Mar. 2015	Updated the note on powering the target board under Table 2 and Table 3	9, 10
2.2, Jan. 2015	Reformatted with Customer-Facing Documents template	All
2.1, Jan. 2015	Added chapter 3.4.4 and Figure 6. Added note on powering the target board under Table 3.	9, 14
2.0, Dec. 2014	Added TFP3L version, connector, and cable description.	All
1.1, Nov. 2014	Added TFP3L version	
1.0, June 2014	Initial release
